CloudSuite Industrial: Creating Form Personalizations (10.18)

Lesson 1: Exploring the data architecture

An **IDO** consists of these elements, select all that apply:

- a) A reference to one or more SQL tables
- b) A set of property definitions
- c) A set of zero or more methods
- d) An optional reference to an IDO Extension Class
- e) None of the above

The Mongoose framework provides standard functionality for all IDOs such as **LoadCollection**, **UpdateCollection** and **GetPropertyInfo** to name a few:

- a) True
- b) False

When an **IDO** is created, select all that apply:

- a) It takes on, or inherits, attributes such as length, nullability, and data type, along with all the other fields on the table and their attributes.
- b) Each field in the table may be bound by a property of the IDO.
- c) The properties are available to a form component to use.
- d) None of the above

Lesson 2: Setting up form editing permissions

Describe the hierarchy of form editing permissions, 1 being the highest and 5 being the lowest.

Description	Hierarchy
Site Developer	2
Full User	3

Vendor Developer	1
Basic User	4
None	5

The Scope Type and Editing Permissions carry out the same functionality.

a) True
b) False

A user with Full Editing permissions can create and delete forms:

a) True
b) False

Lesson 3: Editing forms

Explain how to revert to the previous version of a form.

- Enter Design mode
- Select System>Edit>Revert Form Definition

To use an image on a form, the image needs to be _____ into the system:

- a) Imported.
b) Exported.
c) None of the above

To change the properties of a component on a form, you must use the:

- a) Component Sheet/Tab.
b) Form Sheet/Tab.
c) Object Sheet/Tab.
d) None of the above

Lesson 4: Customizing form components

Name some of the components that can be added to a form.

- Buttons, CheckBoxes, DateCombo, Edit, Combo, Grid, GroupBox, MenuItem, RadioButton, Static

Describe how you would add a component to a form.

- Open form in Design mode
- Check the component from the toolbox

- Move mouse to the form
- Draw the component on the form

Name a tool that is used to align components on a form.

- Align Left
- Align Right
- Align Top
- Align Bottom, etc.

Lesson 5: Using inherited attributes

The levels of inheritance that can be used in the system are:

- Property Class
- Property
- Property Class Extension
- Component Class
- Component
- All of the above.
- None of the above.

Unbound components can use all 5 levels of inheritance.

- True.
- False.

Inherited attributes cannot be changed once applied:

- True.
- False.

Lesson 6: Setting up list sources

A List Source makes it easier for users to select data from displayed lists.:

- True
- False

A list source can be one of these types.

- IDO Collection
- IDO Method
- Inline
- Script
- None of the above

To create a List you must be in **Design Mode**.

- True

b) False

An inline list source has a hard-coded table of values as part of the list specification.

a) True

b) False

Lesson 7: Adding validators to components

Explain the purpose of validators.

- To validate values entered in components

Identify the most commonly used types of validators, select all that apply.

- Alphanumeric
- Date/Time
- Inline List
- In Collection

To create a Validator you must be in **Design Mode**.

- True
- False

Lesson 8: Creating and editing strings

Explain the benefits of strings in the Infor Mongoose framework.

- Reusability
- Consistency

Identify how strings are used.

- As Static label captions
- As Form captions
- As Messages
- As Text

Describe how to create a string.

- By using the Edit>Select String dialog box

Lesson 9: Adding user-extended tables (UETs) fields and user-defined type lists

The user extended tables (UET) feature gives the system administrator the ability to extend existing application database tables and add custom user fields to forms in the application.

- a) True
- b) False

User-defined type refers to a named group of data values that can be used as a list source for a component.

- a) True
- b) False

Explain how to enter a user-defined type list.

- By using the "User Defined Types" form and entering the necessary values.

Explain how to use the user-defined type list feature.

- Once a user-defined type is specified as the source for a component that supports lists, users can add values directly into the user defined type list by means of the Right-Click menu's Add function.

Lesson 10: Setting up event handlers

Explain the purpose of event handlers, select all that apply.

- a) Print Reports
- b) Open Forms
- c) Launch another application
- d) Run a program or script

Identify the types of event handlers that are used in forms.

- Form type event handlers
- Application type event handlers

Describe how to add an event handler to a form.

- Click the Events Tab on the appropriate components
- Select which type of event handler is to be added
- Click on the ellipsis
- Select existing event handler or create a new event handler through the event handler form.

Lesson 11: Form Sync

FormSync is an aid to preserving your customizations when you upgrade, apply a service pack or a single issue fix; or when you distribute and apply your own forms, form modifications and other global objects in Mongoose

- a) True
- b) False

FormSync resolves conflicts between the size and position of customized components and revised settings for size and position during synchronization.

- a) True
- b) **False**

FormSync processes customizations made to the client tier only, that is, forms and global objects. Such customizations are made in WinStudio Design Mode.

- a) True
- b) **False**
