

Check Your Understanding: Answers

CloudSuite Industrial: v10 Using the Application Event System (10.18)

Lesson 1: Introduction to the Application Event System

Name the three basic components of the Application Event System.

- Events
- Event Handlers
- Event Actions

Which of the following is an advantage of the Application Event System over hard-coded systems? Select all that apply.

- a) It reduces the need for writing procedural code
- b) It prevents situations where event handlers could be inadvertently changed
- c) It eliminates the need for metadata
- d) It limits control of the application flow

Lesson 2: Understanding how the system works

Which of the following statements about events and event handlers is true? Select all that apply.

- a) You can temporarily disable an event handler.
- b) Events are either synchronous or asynchronous.
- c) Any event can be suspended.
- d) If an event handler attempts an illegal operation, the system will retry

Match each event-generating situation with its corresponding event. The possible situations are: **Time passes**, **Database calculation is performed**, **User performs an action**, and **Another event occurs, acting as a trigger**.

Event	Event generating situation
The balance of a customer's order becomes more than \$10,000	Database calculation is performed
The first day of the month arrives	Time passes
A salesperson adds a new customer record	User performs an action
You run out of an item and all new purchases have a backordered status	Another event occurs, acting as a trigger

Lesson 3: Using basic system elements

Match each form to its description. The possible forms are: **Access As**, **Event Actions**, **Event Handlers**, and **Events**.

Form description	Form
This form is used to name events.	Events
This form contains a button that links to the Edit Parameters form.	Event Actions
This form displays details on the work to be done when an event fires.	Event Handlers
This form displays who is authorized to modify system elements.	Access As

Which statement best defines an event global constant?

- a) A system-wide event action parameter
- b) A reusable event action
- c) A form for defining global event handlers
- d) A placeholder for a stored value**

Lesson 4: Designing events and handlers

What functionality allows you to change the execution order of your event handlers? Select all that apply.

- a) Keep With and Chronology fields
- b) Access As identifier
- c) Queue First field
- d) Event Handlers Sequence form

Sequence the tasks for determining the name of an IDO for a custom event handler in order from **1-4**.

Tasks	Step number
Locate the Form Properties sheet	3
Enter design mode	2
Select the Collection tab	4
Open the form that uses the IDO collection you need	1

For which type of event can you set up event handlers with the New Workflow Wizard?

- a) All notification events
- b) Simple notification events only
- c) All prompt events
- d) Simple prompt events only

Lesson 5: Viewing event messages

Which of the following are sources for messages that display in the Inbox form? Select all that apply.

- a) Application events that use a Notify action type
- b) Application events that use a Prompt action type
- c) Communications sent by one system user to another
- d) Communications sent from external email to system users

Lesson 6: Tracking event system status

Which form shows the history of events that have finished running?

- a) Event Queue form
- b) Event Revisions form
- c) Event Status form
- d) Suspended Updates form

The Event Revisions form and the Event Handlers Revision form are display-only forms.

- a) True
- b) False

Lesson 7: Requesting approvals - basic

When setting up an event to request manager approval for all new purchase orders, what two action types are needed?

- a) Notify – to notify the manager of each new purchase order
- b) Prompt – to send the manager a message requesting a response
- c) Finish – to tell the system what to do when the approval is received
- d) Fail – to tell the system what to do when approval is denied

What event action parameter function tells the system how to evaluate all possible responses received from a request for approval?

- a) SUBSITUTE
- b) FILTERPROPERTIES
- c) VOTINGRESULT
- d) SETVALUES

Lesson 8: Adding information

Which of the following statements is true about defining an event action that prompts a recipient to send information to add to a record?

- a) The message text cannot exceed 100 characters
- b) Prompts sent to the Inbox form can support free-form responses
- c) The information received must be manually added to the record
- d) Prompts cannot include voting buttons

Sequence the steps that a recipient takes to respond to an Inbox prompt for new information in order from 1-4.

Step description	Step number
Type a value on the Variables tab	3
Open the message	2
Open the Inbox form	1
Click the Post button on the Response tab	4

Lesson 9: Requesting approvals - advanced

Which of the following action types would you use for determining whether a response received resulted in approval or disapproval?

- a) Prompt
- b) Branch
- c) Set Values
- d) Finish

Lesson 10: Generating events from within a form

You can modify framework events but you cannot create a new event from scratch.

- a) True
- b) False

What action type do you select to call an event from a form?

- a) Set event properties
- b) Call component
- c) Call event
- d) **Generate application event**

Lesson 11: Setting up external email

Put the steps in the proper order from **1-4** to set up external email for the Application Event System.

Step description	Step number
Configure CloudSuite for email using the Intranets form	2
Add an email address for each user who is to receive email	3
Designate if a user is to receive prompts, notifications, or both	4
Get SMTP settings for your organization's email server	1

If you set up a recipient to receive prompts via email, which of the following is true when a prompt message is generated?

- a) The message will be sent **ONLY** to the recipient's Inbox form.
- b) The message will be sent **ONLY** to the recipient's email address.
- c) **The message will be sent to BOTH the recipient's Inbox form and email address.**
- d) The message waits for the Send Email event action to fire, and then is sent to the recipient's email address.

Lesson 12: Voting

Match each voting rule to its definition. The possible voting rules are: **1-Majority**, **2-Plurality**, **3-ConditionalPlurality**, **4-EarliestResponse**, and **5-MinimumCount**.

Definition	Voting rules
The choice with the highest number of votes wins.	2-Plurality
The first choice to reach a specified minimum number of votes wins.	5-MinimumCount
A choice must receive more than 50% of the vote to win.	1-Majority
The first response to the prompt wins, regardless of the choice.	4-EarliestResponse
The choice with the highest number of votes wins if a specified percentage of votes is reached.	3-ConditionalPlurality
